Team Details

- Team Name: Cyber Techies
- Team Leader: John Bright
- Problem Statement: Community-Based LPG Sharing & Emergency Access Platform
- Team Members: John Bright, Dinesh Suthar, Rajpratap Baniya

Overview of your solution

- The Idea: A safe online platform that lets verified community members list and trade extra LPG cylinders when there are problems with supply.

- The goal is to connect people who have extra cylinders with people who are running low on them in a dangerous way, so that no one has to use unsafe fuel alternatives.

- Value Proposition: Offers a safe, structured, and verified alternative to the informal and risky "cylinder borrowing" that happens in neighborhoods right now.

Methodology: Wire frame diagram

Tech Stack Used

- Frontend: React.js and Tailwind CSS make a mobile-first UI that works on all devices.
- Backend: Render.com hosts the Node.js Express server.
- Database and authentication: Firebase Firestore (NoSQL) and Firebase Phone Authentication.
- Maps and location: Leaflet.js with OpenStreetMap (an API that doesn't cost anything).
- Claude API (Anthropic) is the AI Engine for the "Safety Advisor" chatbot.

Real World Use Case

- Scenario: A family runs out of gas while waiting for a delivery in a Mumbai suburb because of the monsoon.

- Use: They log into ShareGas, find a neighbor 500 meters away who has an extra cylinder, and make a verified exchange in less than 30 minutes.

- Safety Assurance: Before the transaction is marked as complete, the app makes both users do a "Leakage & Connection" safety check.
